

TRB-015 Proposed Solution

Elite Home Solutions — Step-6 Submission Failure

Ticket: TRB-015

Type: Bug Report

Priority: 5 - Urgent

Submitter: Jason Freeman

Document: Discovery

1. What is Proposed

Immediate Investigation

- Pull server-side logs for the Elite Home Solutions account filtered to this morning's submission window, isolating all events tied to the 6 failed invoice submissions.
- Identify the exact error thrown at step 6 of the submission pipeline (likely one of: validation failure, upstream tax authority API rejection, database write error, or session/auth timeout mid-flow).
- Reproduce the failure in a staging environment using the same 6 invoices (or representative copies with PII scrubbed) to confirm root cause before patching.

Likely Fix Areas (pending log review)

- **Payload validation gate:** audit the invoice field schema against current validation rules; patch any field-level mismatches (e.g., new required fields added to the tax authority API contract).
- **External API call to Arkansas DFA / rebate authority:** check for a recent API schema change, expired credentials, or rate-limit rejection; update the integration layer accordingly.
- **Database commit or transaction boundary:** inspect for constraint violations or deadlock conditions on bulk (6-record) inserts; add retry logic or fix the constraint mismatch.
- **Auth/session check:** extend session TTL for multi-invoice batch submissions or move the auth check to the start of the batch rather than per-invoice.

Code Changes

- Add structured error logging at step 6 that captures invoice ID, payload snapshot (redacted), HTTP response code, and stack trace so future failures are self-diagnosing.
 - Add a user-facing error message at step 6 that tells the submitter which invoice(s) failed and why, rather than a generic failure notice.
 - Write a regression test covering the 6-invoice batch submission path through step 6.
-

2. Desired Outcome

- Elite Home Solutions can successfully submit all 6 invoices (and any future batch) through the portal without failure at step 6.
- The root cause of this morning's failure is documented, patched, and deployed to production.
