

TRB-011 — Discovery Plan

Ticket: TRB-011

Request: Add ability to kick back or undo a queued invoice if number of invoices exceed the allowable submission amount.

Type: Feature Request | **Priority:** 2 - Feature Request

1. What is Proposed

The arktaxrebate portal will enforce a maximum invoice submission limit during the queuing phase of the submission workflow. Two complementary changes are required:

- **Enforcement cap:** When a submitter attempts to add an invoice to the queue, the system checks the current queue count against the configured maximum allowable invoice count. If adding the invoice would exceed the limit, the system blocks the addition and displays a clear inline error message stating the maximum allowed quantity and the submitter's current queue count.
 - **Unqueue (kick-back) action:** For cases where a submitter has already reached or exceeded the limit, each invoice row in the queue view will expose a "Remove" or "Unqueue" action. Activating this removes the selected invoice from the queue, returns it to a draft state, and immediately updates the running queue count. The submitter can remove as many invoices as needed until the count is at or below the maximum, at which point the final submission action becomes enabled.
 - **Queue count indicator:** A persistent counter will be displayed in the invoice queue view showing the current count versus the maximum (e.g., "8 of 10 invoices queued"). This counter updates in real time. When the limit is reached, the counter switches to a warning visual state.
 - **Configuration:** The maximum allowable invoice count will be stored as a configurable value per program/submission period rather than a hard-coded constant, so administrators can adjust it without a code deployment.
-

2. Desired Outcome

A submitter using the arktaxrebate portal cannot finalize a submission containing more invoices than the system-defined maximum. The queue management screen gives the submitter full visibility into how many invoices they have queued relative to the cap, and gives them a direct, low-friction way to remove individual invoices from the queue without losing the underlying invoice data. Administrators can update the maximum invoice limit through existing configuration tooling without a code change. The final "Submit" button remains disabled until the queue count is within the allowable range. Submitters who have over-queued (via any pathway) are guided to resolve the excess before proceeding.

3. Success Criteria

- When a submitter attempts to add an invoice that would bring the queue count above the configured maximum, the invoice is not added and an error message is displayed identifying the limit and current count.
- The "Submit" button is disabled (with an explanatory tooltip) whenever the queue count exceeds the maximum.
- Each invoice row in the queue view displays a functional "Remove" / "Unqueue" action that, when triggered, removes exactly that invoice from the queue without altering others.
- After removing an invoice, the queue count indicator decrements by one in real time without a full page reload.
- After removing invoices sufficient to bring the count to or below the maximum, the "Submit" button becomes enabled.
- The queue count indicator correctly reflects the current versus maximum count at all times, including immediately after add and remove operations.
- If the configured maximum is changed by an administrator, the enforcement logic and counter display use the updated value on the next page load.
- A submitter who navigates away and returns finds their queue state (including any removals) preserved correctly.
- No invoice data is permanently deleted by the unqueue action; removed invoices remain accessible in a draft or unqueued state for later editing or re-adding.
