

TRB-005 — Discovery

Submitter: **Jason S Freeman**

Request: *Process systematically identifies ineligible cities*

Proposed Solution: TRB-005 — Filter ineligible municipalities at submission time

What is proposed

- Maintain a server-side list of eligible Arkansas municipalities for the rebate program (Holiday Island, for example, is currently not eligible). Source: the same dataset that already drives the states/cities dropdown.
- At the dropdown step of the rebate form, hide or grey-out ineligible city entries with an explanatory tooltip ("Holiday Island is not currently part of the Arkansas Tax Rebate Portal program") rather than allowing selection.
- On the server side, reject any submission whose city is not in the eligible list with a clear error message and a link to a "request my city" form so eligibility expansion is captured as demand signal.
- Log every blocked attempt with city + customer id so we can prioritize which cities to add next.

Desired outcome

- A user cannot complete a submission for an ineligible municipality. The blocker happens at the dropdown, not after they have filled out the rest of the form and clicked Submit.
- Customer success has a dashboard of "blocked-by-ineligibility" attempts so they can reach out and / or prioritize expansion.
- The system never accepts and then later fails an ineligible submission — the user gets the rejection immediately.

Success criteria

- E2E test: select Holiday Island in the dropdown → option is greyed-out with the tooltip; cannot proceed.
- API contract test: POST `/api/submit` with `city: "Holiday Island"` returns a structured 422 with a "request my city" link.
- Production telemetry: zero accepted submissions for cities not on the eligible list over a 30-day window.
- Internal dashboard shows blocked-by-ineligibility count by city, sorted descending.
